Green Premium™

An industry leading portfolio of offers delivering sustainable value

More than 75% of our product sales offer superior transparency on the material content, regulatory information and environmental impact of our products:

- RoHS compliance
- REACH substance information
- Industry leading # of PEP's*
- Circularity instructions

The Green Premium program stands for our commitment to deliver customer valued sustainable performance. It has been upgraded with recognized environmental claims and extended to cover all offers including Products, Services and Solutions.

CO₂ and P&L impact through... Resource Performance

Green Premium brings improved resource efficiency throughout an asset's lifecycle. This includes efficient use of energy and natural resources, along with the minimization of CO₂ emissions.

Cost of ownership optimization through... Circular Performance

We're helping our customers optimize the total cost of ownership of their assets. To do this, we provide IoT-enabled solutions, as well as upgrade, repair, retrofit, and remanufacture services.

Peace of mind through... Well-being Performance

Green Premium products are RoHS and REACH compliant. We're going beyond regulatory compliance with step-by-step substitution of certain materials and substances from our products.

Improved sales through... Differentiation

Green Premium delivers strong value propositions through third-party labels and services. By collaborating with third-party organizations we can support our customers in meeting their sustainability goals such as green building certifications.

A transfer switching equipment is indispensable:

For critical applications in particular
For all others in general

A transfer switching equipment is indispensable for applications that need a continuous supply of electric power (hospitals, airports, banks, government facilities, etc.).

However transfer switching equipment is also suitable for all LV electrical installations exposed to:

- > **Nominal voltage loss or dip (when there is high demand for electric power)**
- > **Unpredictable power quality**

> **Frequent power cuts**

These factors, and many others, can damage the continuity of service of your electrical installation.

For infrastructure managers, a source-changeover system gives direct economic benefits. It is possible to select your source based on power cost.

In this case, the replacement source is used as an alternative, more economical source.

- > **Managing energy efficiently**
- > **Power Cost**
- > **Safety**

Where backup supply must be reliable: now that is everywhere

Electricity is the fuel that feeds economic activity. Very few operations can withstand the financial impact of an electrical stoppage.

For occupant comfort, business continuity, and worker/visitor safety, dependability levels that used to apply to hospitals or airports are now becoming required in shopping malls and offices.

Additionally, utility companies make their contracts more sophisticated to deal with energy concerns. For example, including time restrictions to total accessible power.

For these reasons, backup power sources expand across all types of buildings, and require high performance connection and management.

Enabling you to meet these challenges, TransferPacT comes as the natural continuation of the world leading low voltage distribution system developed by Schneider Electric.

\$740 000

average cost per event of
unplanned downtime in a
data center

Source

3 ways to switch the load to meet your needs

①

Automatic Source-Changeover System (or ATSE: Automatic Transfer Switching Equipment)

An automatic controller may be added to a remote-operated source-changeover system. It is possible to automatically control source transfer according to programmed (dedicated controllers) or programmable (PLC) operating modes. These solutions ensure optimum energy management.

System

Derived ATSE: Two or three circuit breakers that may have different configurations, linked by an electrical interlocking system. A mechanical interlocking system protects against electrical malfunctions or incorrect manual operations, with an automatic control system (dedicated controllers or PLC).

Non-derived ATSE: Specifically designed ATSE with a specific controller for the system. A mechanical interlocking system is standard for product which protects against electrical malfunctions or incorrect manual operations.

②

Manual Source-Changeover System (or MTSE: Manual Transfer Switching Equipment)

A very simple way to switch the load. It is controlled manually by an operator. The time required to switch from the 'N' source to 'R' source can vary.

System

Two or three mechanically interlocked manually-operated circuit breakers or two switch-disconnectors.

③

Remote-Operated Source-Changeover System (or RTSE: Remote Transfer Switching Equipment)

The most commonly used system for devices with high ratings. No direct human intervention is required. Source-changeover is controlled electrically.

System

Derived RTSE: Two or three circuit breakers that may have different configurations, linked by an electrical interlocking system. In addition, a mechanical interlocking system protects against electrical malfunctions or incorrect manual operations.

Non-Derived RTSE: Specifically TSE that is electrically operated and not self-acting. A mechanical interlocking system is standard for product which protects against electrical malfunctions or incorrect manual operations.

Applications

Commercial and service sector industry and infrastructure (operating rooms in hospitals, safety systems for buildings, computer rooms for banks and insurance companies, lighting and emergency lighting systems in malls, etc.)

Buildings and infrastructure where the need for continuity of service is significant but not a priority: offices, small and medium-sized businesses.

Industry like assembly lines, engine rooms on ships, critical auxiliaries in thermal powerstations, etc.

Infrastructure like port and railway installations, runway lighting systems, control systems on military sites, etc.

Whatever the system, you benefit from our expertise!

For many years Schneider Electric's source changeover system have proved their reliability everywhere around the world, in most power dependable buildings. Switching is performed by ComPacT or MasterPacT circuit breakers, the ultimate references in industrial switchgear.

Maximized Continuity of Service

- > Energy availability is ensured whatever is the external requirements (e.g. high power demand).
- > Maintenance and replacement of the sources (N or R) can be done with no interruption of service.

You can maintain a continuous level of service and customer satisfaction.

Maximized Safety

For LV electrical installations where safety and continuity of service are critical for people and/or equipment such as hospitals, airports, banks, malls, etc.

Optimized Energy Management

- > Transfer the load to a replacement source according to external requirements.
- > Manage power sources according to power quality and power costs.
- > Perform system regulation.
- > Switch to an emergency replacement source.

You are no longer dependent on your power supply (and supplier)

Simplicity and Reliability

- > Simple installation on LV switchboard.
- > Optimized size of the switchboard.
- > System based on pre-tested components.
- > Compliance with IEC 60947-6-1.

Definition of Class PC

Transfer switch equipment based on mechanical switching devices, that do not need electrical power to hold the main contacts open or closed. They are capable of making, carrying, and breaking currents under normal circuit conditions including operating overload conditions, and making and withstanding short-circuit currents.

Definition of ATSE (Automatic Transfer Switching Equipment)

Self-acting transfer switching equipment, including all necessary sensing inputs, monitoring, and control logic for transferring operations.

TransferPacT automatic transfer switching equipment is a Class PC ATSE specially designed in accordance with IEC 60947-6-1 requirements for power transfer. It has great withstand capabilities to short circuits and reliable making, carrying and breaking capabilities. Thus keeping reliable connectivity of circuits.

It is an all in one, Non-derived ATSE.

TransferPacT Class PC

TransferPacT is a high speed, comPacT, modular design intelligent automatic transfer switch that provides maximum scalability and robust performance. It is a Class PC ATSE designed according to IEC 60947-6-1, available through 32 A to 630 A, 2,3,4 pole with rated operating voltage through 208 V to 440 V*.

*Note: Voltage varies depending on different frame. For more information, see general feature section.

A

Power availability

Maximized uptime:

Innovative technology ensuring transfer in less than 500 ms.

Vast application:

Utilization category AC-33B without derating, fits the most complicated load types.

Reliable under extreme condition:

Short circuit capabilities including short time withstand current for your power continuity.

Robust design – Extreme Environment Proof:

- Best-in-class electromagnetic protection, exceeding industry standards on class B.
- Designed to perform in harsh environments with operating temperature -25...70 °C
- Successfully passed testing in compliance with IEC 60068-2-6 and IEC 60068-2-27.

Efficiency

Easy installation:

- Built-in DPS and sensing wire, 30% of commissioning time saving.
- Multiple installation adapted. E.g. DIN rail for 32 A ~160 A (TA10, TA16).

Enhanced scalability:

- 10 function modules plug and play, non-disruption upgrading.

Connectivity

Natively connected – Integrated in EcoStruxure™ Power

- 24/7 precise power monitoring on voltage, frequency, voltage unbalance, phase rotation.
- Predictive maintenance with hands-on approach and cloud-based monitoring software that synthesizes and analyzes performance and alert data into proactive recommendations. TransferPacT enables wherever-you-go visibility.

Cyber security

Designed according to cyber security standard IEC 62443 at the level of SL1.

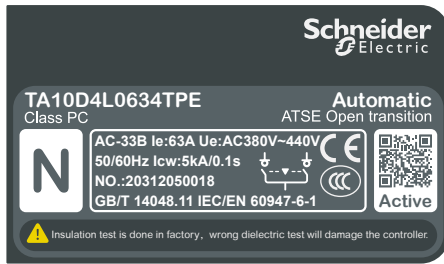

Sustainability

Green premium ecolabel.

- Green Package for full product range.
- Saving trees - Scan QR code for full version for technical documents.

General Features

Codes and Standard

- IEC 60947-1 General rules
- IEC 60947-6-1 Transfer switching equipment
- GB 14048.1 General rules
- GB/T 14048.11 Transfer switching equipment

Certifications and Declarations

- CB certification
- CE certification
- CCC certification
- UKCA declaration

Environmental Conditions

- TransferPacT ATSE can operate in an ambient temperature of $-25^{\circ}\text{C} \sim +70^{\circ}\text{C}$
- The altitude of the installation site shall not exceed 2000 m
- When the highest temperature is $+55^{\circ}\text{C}$, the relative humidity in air shall not exceed 95%
- Storage temperature: $-35^{\circ}\text{C} \sim +85^{\circ}\text{C}$

Vibration and Shock

- Tests are carried out in compliance with IEC 60068-2-6 and IEC 60068-2-27

Electromagnetic Compatibility (EMC)

- EMC Class A
- EMI Class B
- Electrostatic discharge Level 4
- Radio-frequency electromagnetic field Level 3
- Fast transient bursts Level 4
- Surges Level 4
- Harmonic wave Level 3
- Voltage dips and short-time interruptions Level 3

Degree of Pollution

- Pollution degree 3 as defined by IEC standard 60947

Controller General Features

TransferPacT provides advanced microprocessor controller with two options:

- Active automatic HMI (LCD display and keypad)
- Automatic HMI (Rotary and DIP switch).

It is a robust and reliable controller which offers voltage, frequency, control, timing and diagnostic functions required for wide range of power application.

Automatic HMI is easy to install and use, while active automatic HMI contains every function needed with eight control modes.

There are two key breakthroughs for TransferPacT controller:

- Active automatic HMI and automatic HMI can be swapped, that means an easy way to upgrade your controller, or replace it for maintenance or renewal.
- 10 types of function modules can be installed on TransferPacT controller, at any time, which provides maximum scalability and a reduced total cost of ownership, since you can add a function as demand grows.

NOTE: The LED indicator on the equipment and the external HMI is for reference. In the event of a contradiction between the LED and the mechanical indication, the latter prevails

Control Mode and Transfer Logic Transfer Switching Equipment 32–630 A

Overview

The control mode is used to operate TSE in different applications. The TransferPacT Active automatic contains every function needed with nine control modes:

- Auto mode
- Test mode
- Communication transfer mode*
- Voluntary transfer mode
- Local control mode
- Transfer inhibit mode
- Fire protection mode
- Force to off mode
- Handle transfer mode

The TransferPacT Automatic contains below control modes:

- Auto mode
- Test mode
- Voluntary transfer mode
- Transfer inhibit mode
- Fire protection mode
- Force to off mode
- Handle transfer mode

* communication transfer for Frame 250 and Frame 630 only

Priority of Control Mode

Type of mode	Handle	Force	Fire	Inhibit	Local	Voluntary	Comm	Test	Auto
Handle transfer mode	-								
Force to off mode	x	-							
Fire protection mode	x	x	-						
Transfer inhibit mode	x	x	x	-					
Local control mode	x	x	x	x	-				
Voluntary transfer mode	x	x	x	x	x	-			
Comm transfer mode	x	x	x	x	x	x	-		
Test mode	x	x	x	x	x	x	x	-	
Auto mode	x	x	x	x	x	x	x	x	-

“-” = No caution
 “|” = Interrupt
 “X” = Ignore

Control Mode and Transfer Logic

Transfer Switching Equipment 32–630 A

Auto Control Mode

ATSE works on auto control mode normally. The controller monitors the real time values of both the sources. When there is source contingency, the transfer action will be energized to keep the power continuity for critical source.

Auto mode supports U-G or U-U applications.

NOTE: Auto transfer will not be active, if transfer action damages driving system (for example, both are out of range, TSE refuses to transfer).

There are two types of auto control mode:

- Auto-return
- Non-return

Naming	Condition for Stay on A Situation Return	
power source definition	N available	N available
	A available	A unavailable
Auto-return	Switch to N	Switch to N
Non-return	Stay at A	Switch to N

Auto return

The Auto return has two modes:

- When the voltage on the N source exceeds the threshold (over voltage, under voltage, over frequency, under frequency) or does not exist, the ATSE will be transferred to the A source.
- When the voltage on the N source is within the threshold range, the ATSE will be transferred to N source.

The process of transfer can be controlled by time delay.

Transfer Process for Auto return U-U Application

Symbols	Description
Un	Source I
Ua	Source II

Control Mode and Transfer Logic

Transfer Switching Equipment 32–630 A

Non-Return

In the non-return mode, after auto transfer to replacement, the ATSE will be connected to the alternate source until:

- An external order is given to transfer back to N source.
- The alternate source is out of range. In such case, the ATSE controller will transfer back to the N source to maintain power availability.

There will be only one time power off, when there is normal power outage.

Communication Control Mode

The communication control function allows TSE to transfer or test through communication. The switch can refuse to respond if the action will damage the driving system. It cannot transfer to unavailable source either.

The communication control function can be enabled/disabled through Active Automatic HMI (only available for TransferPacT Active Automatic transfer switch equipment).

To use the communication control successfully, at least one Modbus module should be installed and activated.

NOTE: Communication control is OFF by default. Follow the instructions below to enable communication control.

Transfer by Communication

Transfer Logic Overview

Transfer by communication support the following four commands:

- Comm to Normal Source
- Comm to Alternate Source
- Comm to OFF
- Comm to Exit

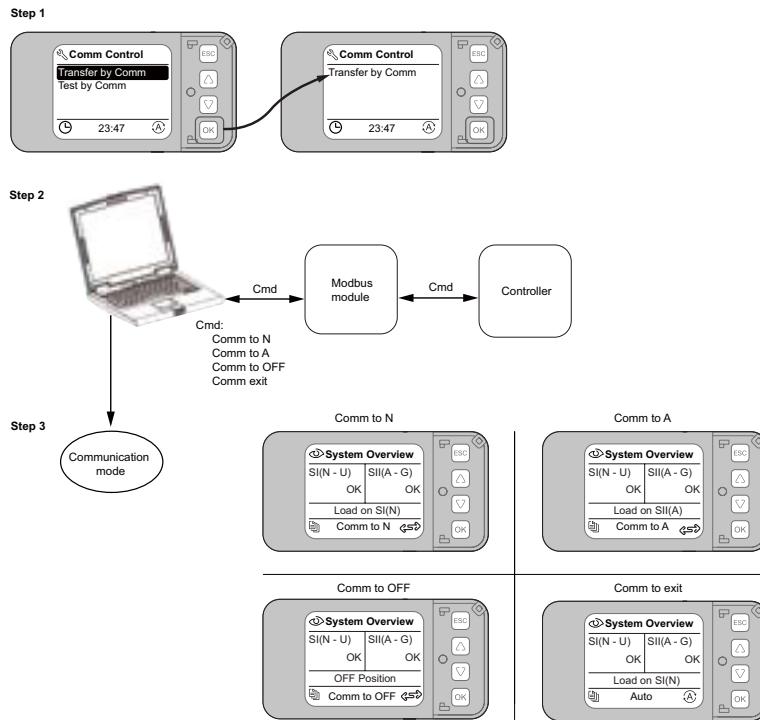

The command is sent through PC - Modbus. Comm to N/A is equivalent to the voluntary transfer mode on the transfer result. Comm to OFF is equivalent to local control to Off, but not equivalent to force to Off. The ATSE will transfer to OFF after receiving the command without any time delay.

When more than one Modbus modules are installed, the ATSE will only respond to the module which will send the command first. It will not response to any command from other modules until the first module sends the Exit command.

Control Mode and Transfer Logic

Transfer Switching Equipment 32–630 A

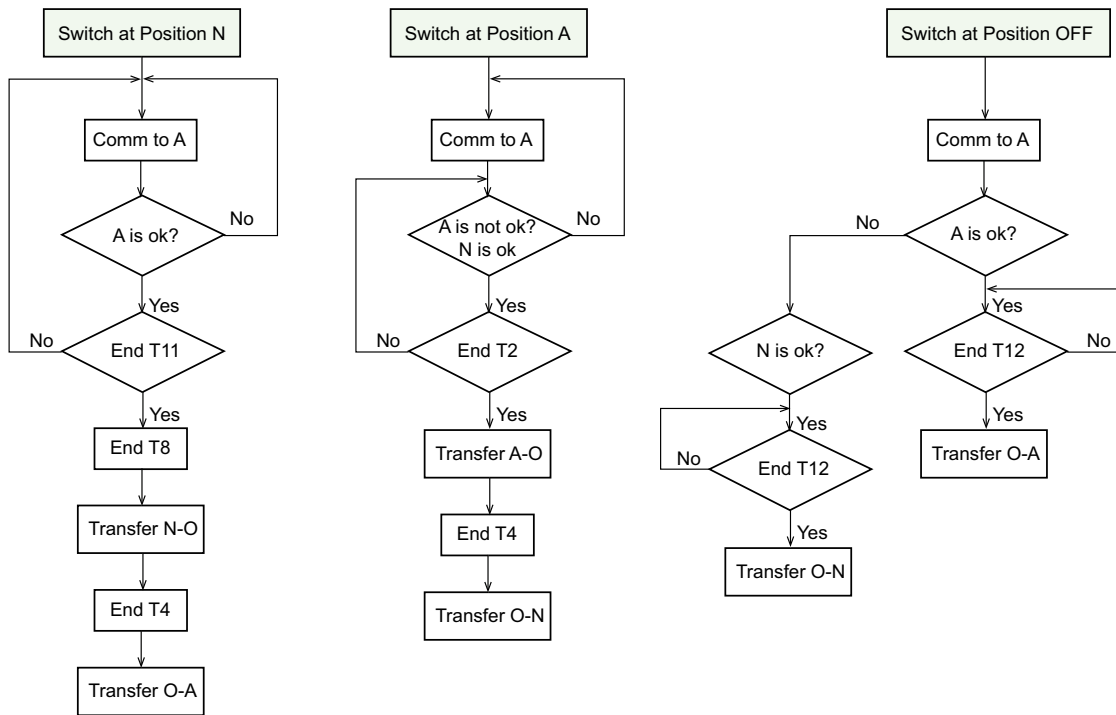

Exit Communication Control Mode

There are three ways to exit communication control mode:

- The Modbus master device sends the Exit command to the active Modbus module installed on ATSE.
- Turn off Transfer by Comm from active automatic HMI.
- The active Modbus module is offline.

Control Mode and Transfer Logic Transfer Switching Equipment 32–630 A

* T11 is internal fixed time delay

Transfer Logic of Communication to Off

Comm to OFF is equivalent to local control to off in Local Control Mode, but different to Force to Off Mode. The ATSE will transfer to off after receiving the command without any time delay. For more information, see Local Control Mode, page A-44.

Control Mode and Transfer Logic

Transfer Switching Equipment 32–630 A

Test by Communication

Transfer by communication that supports the following three commands:

- On Load Test
- Off Load test
- Test Exit

When more than one Modbus modules are installed, the ATSE will only respond to the module which send the command first. It will not respond to any command from other modules until the first module sends the Exit command.

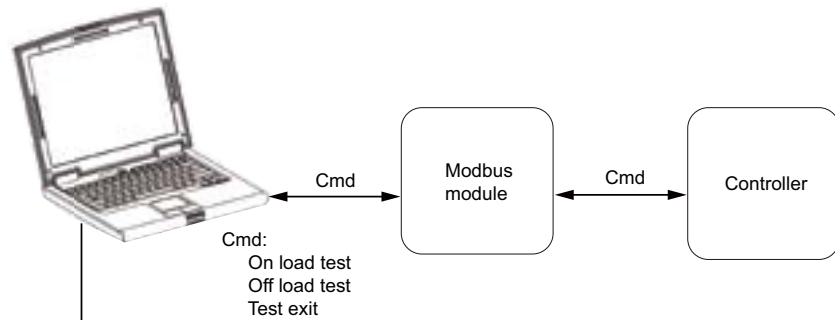

When the test is ongoing, ATSE ignores any other interface signal from active automatic HMI or DI module (TPCDIO07).

The operation of Test by communication is equivalent to Test mode. For more information, see Test Mode, page A-37.

Step 1

Step 2

Step 3

Stop Test by Communication

There are three ways to exit communication control mode:

- The Modbus master device send Test Exit command to the active Modbus module installed on ATSE.
- Turn off Test by Comm from active automatic HMI.
- The active Modbus module is offline.

Control Mode and Transfer Logic

Transfer Switching Equipment 32–630 A

Voluntary Transfer Mode

The voluntary transfer mode is equivalent to auto-priority mode on one source, with forced priority to the SI or SII source. It is activated when associated input is closed (the commercial reference number for the voluntary control module is TPCDIO08). It takes over 200 ms to activate the voluntary mode. The signal for voluntary transfer should be constant.

Voluntary transfer is normally used for special tariffs. Once the mode is set from voluntary to N or A, ATSE still remains in auto mode. When there is power contingency on target source, transfer switch can re-transfer to available source automatically.

NOTE: Auto transfer will not be active, if transfer action damages driving system (for example, both source are out of range, TSE refuses to transfer).

The following are the voluntary transfer mode use cases:

Use Case 1: Typhoon Mode

During typhoon or earthquake, the Genset will be more stable than utility. The user for this case has installed a typhoon mode switch on his control panel. The user will activate the typhoon mode switch. It is connected to the input voluntary transfer mode which will transfer to alternate source (need accessory to have function of voluntary transfer using TPCDIO08 accessories). The ATSE will now activate the Genset output and will transfer to Genset once ready.

Now during the typhoon, the Genset is flooded. The ATSE will still be in auto mode. It detects alternate source failure. If the normal source is fine, it will try to transfer to normal source (voluntary is still an auto mode, and we have auto-return). If the normal source is not available then ATSE will not do any transfer. Still during typhoon, the Genset can restart (it was a fuel level problem). As the typhoon mode switch is still enabled, the ATSE will transfer back to the Genset. The Genset output keeps activated.

So, whatever the source is connected, the typhoon is gone. The utility is back to normal. The user will deactivate the typhoon mode switch. The ATSE will transfer back to normal source at auto mode with auto-return, U-G.

The configuration needed is a ATSE along with voluntary transfer module. With this configuration, the user don't need to play with any ATSE settings (return mode, priority source, what is the normal source).

Use Case 2: Peak Tariff (Align with Controller UA/BA)

Initially this feature was created in UA BA in France for Special Tariff Fare (STF) capability. Special Tariff Fare (STF) in France is a special electricity pricing that allows to have discount price on low consumption hours, with the drawback of having a very expensive kWh price on peak hours. With this option, EDF (French utility) provides an output on the energy meter to warn the end user about the price increase. This output is wired on the voluntary transfer input of the controller, which automatically transfers the load to a cheaper alternate source. This allows to help shedding the peaks on the network.

Test Mode

The test mode is a procedure to simulate the transfer process with following purpose:

- Test normal transfer actions for ATSE-On load test
- Test Genset-Off load test
- Test Genset-Transfer functions-On load test

Ways to Start Test

There are three ways to conduct the test:

- Through Active Automatic HMI.
- Through DI using TPCDIO07 accessories.
- Through Modbus communication using TPCCOM16 module.

There is no priority among the test command from HMI, DI and Modbus. ATSE will act upon receiving the command from any way.

When the test is ongoing, ATSE ignores any other command until receiving the command to exit test.

Command to exit test should be sent through the same way used to start the test. Otherwise ATSE will not respond. For example, if you start the test through DI module, you have to stop the test through DI module as well.

Default Time for Test

- Default as unlimited test (no time duration, has to stop the test manually).
- If you select limited test, the default time duration is 30 s.

Time Range for Test

- 10 s–1800 s with steps of 1 s.
- Time delay can be bypassed by pressing ESC key in Active Automatic HMI.

Pre-Condition to Start Test Mode

The following conditions are mandatory for the test:

- ATSE is in auto mode.
- ATSE is in normal position while in U to U Application.
- ATSE is in alternate position while in U to U Application.
- ATSE is in normal position while in U to G Application.
- For U-U application, R source shall be available before test. Otherwise, there will be an alarm.
NOTE: On load test will not be active, if transfer action damages driving system (for example, both source are out of range, TSE refuses to transfer).

Off Load Test

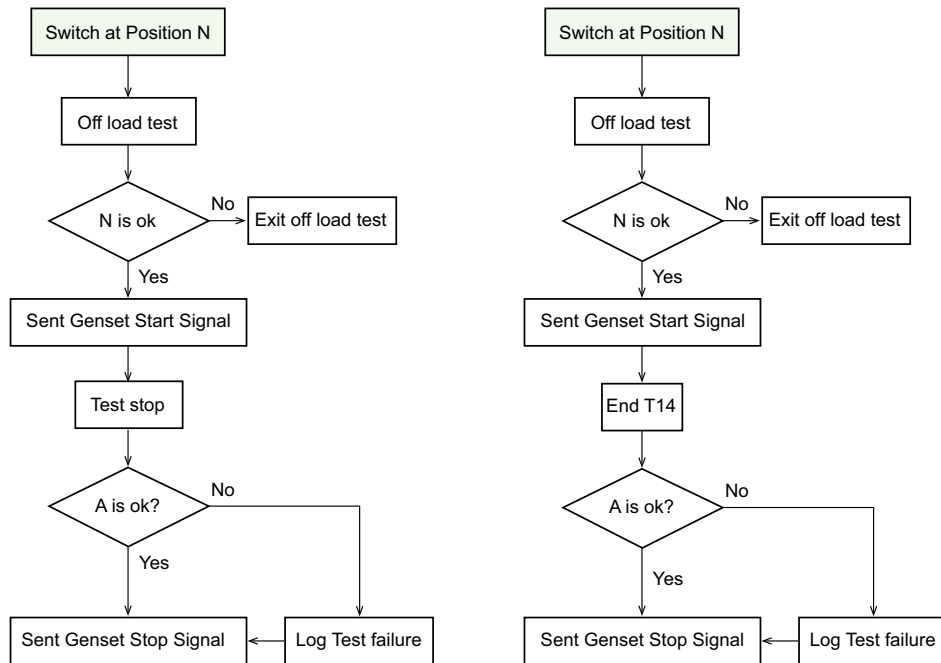

- The purpose of this function is to check the Genset can start, without power interruption.

NOTE:

- This test does not check if the switch is able to make the transfer.
- The test is only available with U-G configuration.
- The off load test should not be proposed, when the ATSE doesn't have Genset output feature.
- This function will only be accessible for product with HMI, as the Test mode default value is On load.
- The orders from higher priority will interrupt the test procedure.

Control Mode and Transfer Logic Transfer Switching Equipment 32–630 A

Off Load Test

T14 is Unlimited

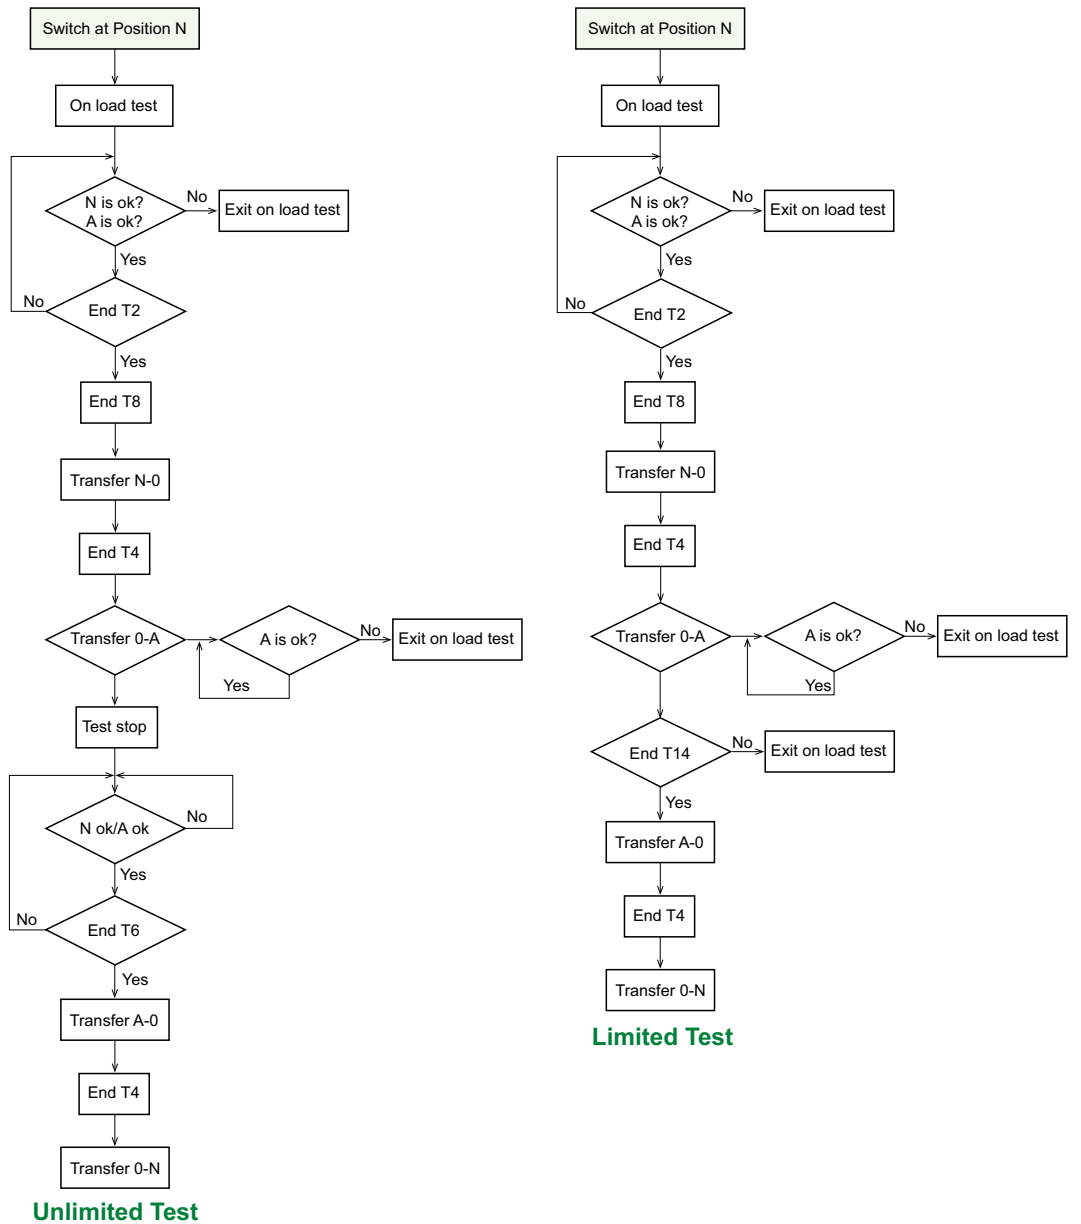

T14 is Limited

On Load Test

- The purpose of this function is to execute ATSE transfer (when the source is still valid) to make sure the system is still able to execute the transfer. The UU and U-G configuration are both available.
- When the ATSE receive the testing start request:
 - The ATSE shall initiate the transfer to the Alternate source if the Alternate source is in range, and according to the transfer delays (T7, T2...).
 - The ATSE shall log a test start event.
- Two conditions to return to N source:
 - When the ATSE receive the stop request from user.
 - When the Test timer is activated, and the test timer is completed.

Return or Start from Auto Mode at Off Position

When switch is at OFF position, this state is interim, and it happens under two conditions:

- Enter the auto mode from other modes or from power on.
 - End of off delay (T4), ATSE is unable to switch to N or A, due to both power source loss (with 24 V).
- The load shedding will be activated from OFF to A source in both U-U and U-G configuration.

* T12 is internal fixed time delay.

Control Mode and Transfer Logic

Transfer Switching Equipment 32–630 A

Local Control Mode

⚠ CAUTION

HAZARD OF EQUIPMENT DAMAGE

Enable the local control through Active Automatic HMI to exit the auto mode.

Failure to follow these instructions can result in injury or equipment damage.

NOTICE

POTENTIAL POWER OUTAGE OF EQUIPMENT

To re-enter Auto mode, disable local control through Active Automatic HMI or External HMI.

Failure to follow these instructions can result in equipment damage.

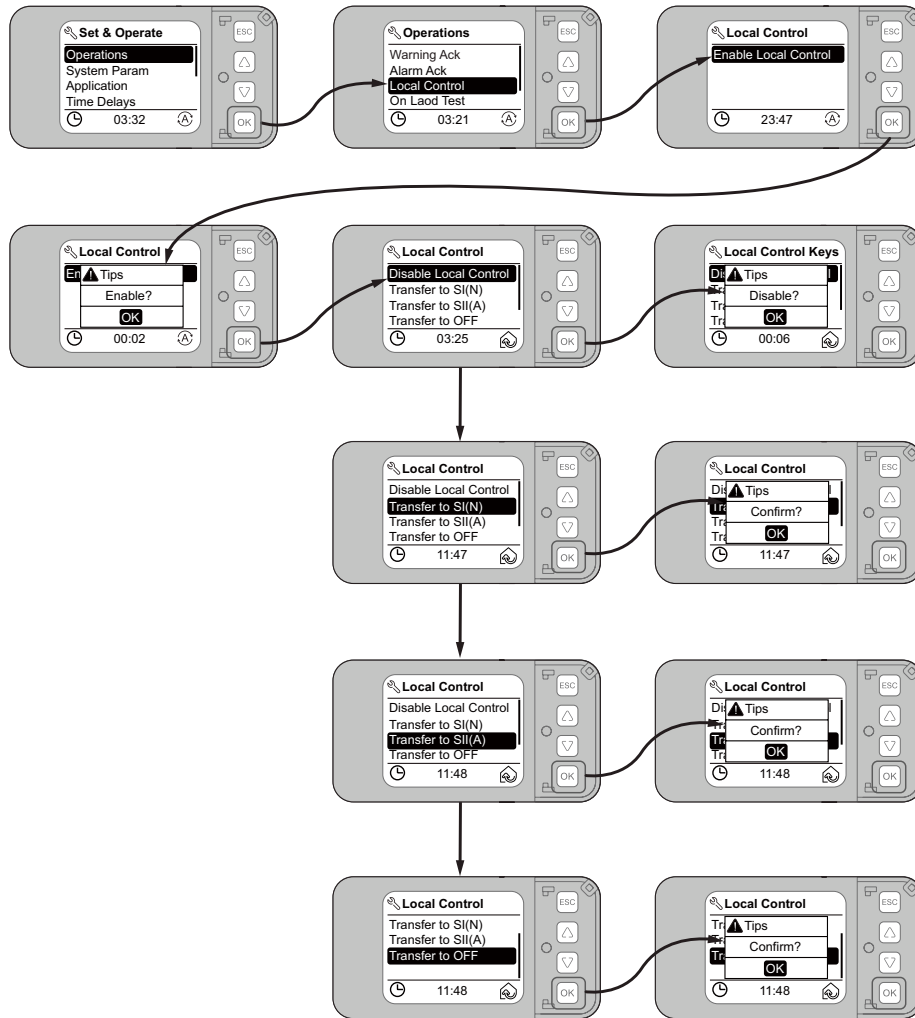

The local mode is activated through the HMI (only available for Active Automatic, RS version change to Automatic). It allows locally to change the logical position of the TSE. The switch will refuse to active if the action will damage the driving system. It cannot transfer to unavailable source.

NOTE: Local transfer will not be active, if transfer action damage driving system (for example, both overvoltage are out of range, TSE refuses to transfer) or both sources are out of operating voltage of solenoid.

Auto Genset start signal and load shedding signal is not available for this mode. In this case, the target source conformity is verified before transfer and time delays are not considered.

A

Control Mode and Transfer Logic Transfer Switching Equipment 32–630 A

Local Control to N

The command is sent through HMI. There is no time delay except OFF delay. The switch will transfer to normal after receiving the order to it when normal power is in tolerance.

Local Control to A

The command is sent through HMI. There is no time delay except OFF delay. The switch will transfer to alternate after receiving the order to it when alternate power is in tolerance.

Local Control to O

The command is sent through HMI. There shall be no time delay. The switch will transfer to OFF after receiving the order to it.

Control Mode and Transfer Logic

Transfer Switching Equipment 32–630 A

Transfer Inhibit Mode

When the transfer inhibition input is active, the controller can not send any order to TSE. Front face selection buttons are locked and the HMI only displays transfer inhibit.

Fire, Force to OFF and Handle mode still works as before. When exit Fire, Force to OFF and Handle mode, transferring blocked by transfer inhibit.

Use this mode only when inhibit signal (from DI) is active and no higher operation mode is running. When ATS transfer is ongoing, wait until transfer completed.

Exit this mode after inhibit signal is inactive.

Accessories are required using TPCDIO07 to extend this function of the TSE.

Application

- Transfer inhibit occurs when there is power interruption because of short circuit.
- This function can be used to lock the controller by customized signals.
- This function can be used for cooperation with different ATSE.

Fire Protection Mode

- An emergency stop order to transfer ATSE to off position. All the other transfer mode will be canceled except force to OFF and handle control. There shall be no time delay.
- Exit fire protection after signal disappeared.
- Require accessories TPCDIO10 or TPCDIO11 or TPCDIO13 or TPCDIO14 to extend this function.

Application

- The fire protection signal can transfer ATSE to off position when there is fire emergency.

Force to OFF Mode

- Transfer ATSE to OFF position with an emergency stop order. All the other transfer mode will be canceled except handle control. There should be no time delay.
- Exit Force after signal disappeared.
- Accessories are required using TPCDIO07 to extend this function of TSE.

Handle Transfer Mode

- The handle or manual transfer mode is activated from the TSE directly. It deactivates the controller control function except position status (outputs and LEDs), source status LEDs and alarm LED.
- No operation for load shedding and generator, keep the status as before.
- No alarm relay output.

Controller Accessories

Load Shedding and Availability Warning

Function:

Load shedding

- The emergency power (Genset) sometimes may not afford all loads. A signal from controller will shed some non-critical loads
- Load shedding will send the signal after enabling this function

Availability warning output

- When transfer switch is not in auto or power lost on two sources, a dry contact will output the signal
- After back to Auto status or power recovery, the signal will be stopped

Compatibility: Active Automatic and Automatic

Rating: 250 VAC, 5 A or 30 VDC, 5 A

Digital output

Transfer Inhibit and Remote Testing

Function:

Transfer inhibit

- Transfer Inhibit when there is power interruption because of short circuit
- This function can be used to lock the controller by customized signals
- This function can be used for cooperation with different ATSE
- Remove transfer inhibit signal to Exit this mode

Remote testing

- Remote testing is an input signal to start test procedure.
- The remote test can only be started at Auto mode
- For Active Automatic HMI, on load, off load test and time duration can be selected.
- For Automatic HMI, on load test is unlimited.

Compatibility: Active Automatic and Automatic

Dry Contact

Digital input

Voluntary Remote Control

Function:

Voluntary transfer to N or A

- Voluntary transfer is an active input. It can transfer the ATSE to Normal or Alternate source according to requirements (such as energy saving)
- Voluntary transfer will still keep the power continuity as much as possible. The function will be bypassed if target source loses the power. For example, after voluntary to A while A source failed, ATSE will transfer back to N if N is available
- Exit voluntary mode after signal disappeared

Force to Off

- An emergency stop order to transfer ATSE to off position. All the other transfer mode will be canceled except handle control
- Exit Force after signal disappeared

Compatibility: Active Automatic and Automatic

Dry Contact

Digital input

Controller Accessories

Fire Protection

Function:

The fire protection signal can transfer ATSE to off position when there is fire emergency.

- Fire protection with input of DC24 V pulse signal. Input Voltage: 24 VDC (-20% ~ +20%), Maximum Input Current: 10 mA
- Fire protection with input of DC24 V Constant signal. Input Voltage: 24 VDC (-20% ~ +20%), Maximum Input Current: 10mA
- Fire protection with input of AC230 V Constant. Input Voltage: 230 VAC (-20% ~ +20%), 50 Hz/60 Hz Maximum Input Current: 10 mA
- Fire protection with 1 input, dry contact

Compatibility: Active Automatic and Automatic
Digital input

A

BUS Extension and 24 VDC Auxiliary Supply

Function:

BUS extension

- Can be used to connect external HMI

DC 24V Auxiliary Supply

- External power for controller when both source failure
- External power to keep power for Modbus communication when both source failure

Compatibility: Active Automatic

Rating: Input Voltage: 24 VDC (-20% ~ +20%), Maximum Input Current: 1 A

Modbus RTU (Serial Port)

Function:

Modbus

- Can be used to connect with other system
- Require External 24 V or at least one main source to keep communication
- With Protocol Modbus RTU communication

Compatibility: Active Automatic

Genset Start and Alarm

Function:

Genset start output

- When utility source is lost, a dry contact will start Genset. No matter with or without external 24 V, a time delay (T7) before genset start can be set
- When Utility source has recovered, and ATSE has transferred back to Utility, Genset signal will remain until end of Genset cooldown timer

Alarm

- When there is critical alarm, a dry contact will output the signal
- Restart controller (open and close dielectric door) to shut down the Alarm

Compatibility: Active Automatic and Automatic

Rating: 250 VAC, 5 A or 30 VDC, 5 A

Digital output

Note: The alarm signal is irrelevant to generator start or stop. It is relevant to transfer errors and phase rotations errors, for more detail, refer to DOCA0214EN-00

Controller Accessories

Auxiliary Contact Module

- TPSAUX43: Provide the open and closed status indication for both source I and source II .
- TPSAUX44: Provide the open and closed status indication for OFF position .

Insulating Accessories

Terminal Shield

Optional accessory, Provide terminal protection on the cable incoming and output.

- TPSISO42: Terminal Shield (set of 1)

Interphase Barrier

Optional accessory, Provide protection for the cable incoming and output, effectively avoiding short circuits between phases.

- TPSISO65: Interphase barriers (set of 3)

Insulation Screen

Optional accessory, Provide protection for the cable incoming and output.

- TPSISO67: Insulating screen (set of 1). Applicable for source and load, maximum 3 set.

External HMI

Overview

The external HMI is used to display the HMI on the panel. The HMI consists of external HMI base and a LCD screen.

The external HMI must be connected with the function module with commercial reference as TPCDIO15. The connection of the external HMI is done using a cable and an external HMI base and LCD display.

Position of External HMI and Switch

Perform the following procedure to connect the external HMI on the panel door.

1. Rotate the external HMI to the back side.
2. Remove the nut of external HMI.
3. Insert the external HMI on the front door.

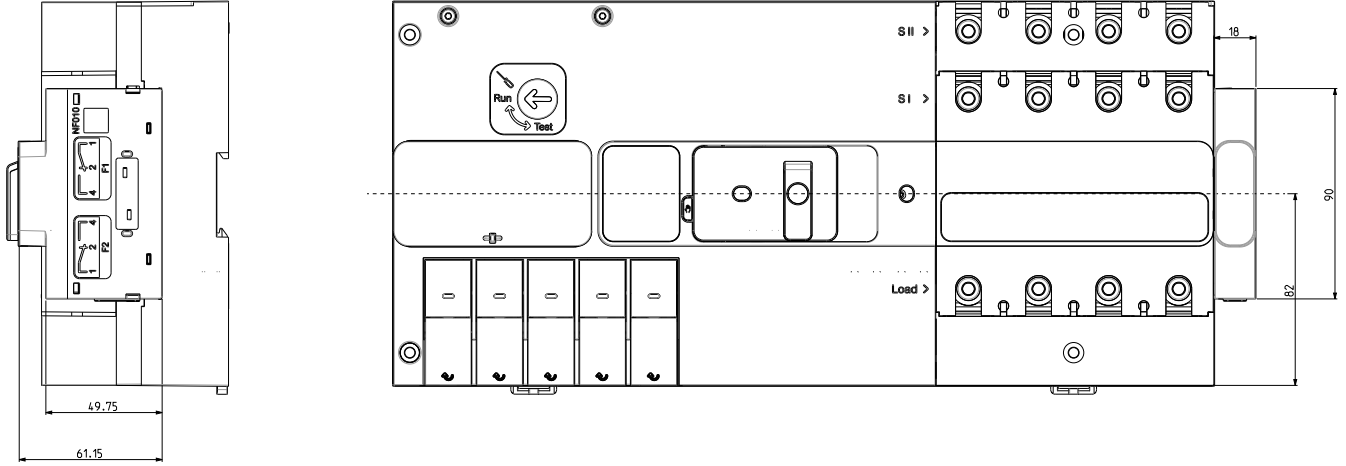

NOTE: Please make the cutout on the front door as per the dimension given.

4. Insert the nut.
5. Lock the nut.
6. Insert the cable into the external HMI.
7. Insert the other end of the cable into the function module (TPCDIO15).

Coding Principle

The commercial reference of TransferPacT Automatic Transfer Switching Equipment is coded with significant features to explain the type of frame rating, transition, controller type, rated voltage, rated current and number of poles

TransferPacT Class PC

R

RTSE: Remote Transfer Switching Equipment

(Non-derived RTSE, PC Type)

Definition of Class PC

Transfer switch equipment based on mechanical switching devices, that do not need electrical power to hold the main contacts open or closed and capable of making, carrying, and breaking currents under normal circuit conditions including operating overload conditions, and making and withstanding short-circuit currents.

Definition of RTSE(Remote Transfer Switching Equipment)

Transfer switching equipment that is electrically operated and not self-acting.

It is the most commonly used system for transfer loads without direct human intervention. Transfer process is conducted electrically. In some occasions, customers want to use a third-party system to control the TSE from distance (such as control room), or users want to use an intelligent system to operate the TSE, which requires remote control functions.

TransferPacT Remote is a class PC, solenoid drive all in one RTSE.

TransferPacT RTSE has intelligent control with CPU integrated in switch, it is designed to manage the transfer according to the incoming command of the third party. It can work with third party system, like generator-set controllers, PLCs etc.

General Features

Power availability

Vast application:

Utilization category AC-33B without derating, fits the most complicated load types.

Reliable under extreme condition:

Short circuit capabilities including short time withstand current for your power continuity.

Robust design – Extreme Environment Proof:

- Best-in-class electromagnetic protection, exceeding industry standards on class B.
- Designed to perform in harsh environments with operating temperature -25...70 °C
- Successfully passed testing in compliance with IEC 60068-2-6 and IEC 60068-2-27.

Efficiency

Easy installation:

- Built-in DPS and sensing wire, 30% of commissioning time saving.

Easy Operation:

- Simple reliable mechanism, manual and remote operation available
- Input and output terminals to provide product status and operation
- Wide voltage range for multiple grid: 208 VAC-240 VAC, 380 VAC-440 VAC.

Sustainability

Green premium ecolabel.

- Green package for full product range.
- Saving trees - Scan QR code for full version for technical documents.

Cyber security

Designed according to cyber security standard IEC 62443 at the level of SL1.

B

General Features

Besides the terminals for I/O signals, it also provides power and product state and alarm indication through LED indicator on product front face. TransferPacT Remote is designed to manage the transfer according to the incoming command of the third party. It can work with third party system, like generator-set controllers, PLCs etc.

B

Terminal Definition and Transfer Process

Terminal Definition

TransferPacT Remote provides transfer solutions with input and output terminals.

Description	Terminal label	Definition
Product Availability	P0	Common Terminal for P1,P2
	P1	output signal, when either source voltage is in range and product is NOT in manual mode, NO terminal will close.
	P2	output signal, when either source voltage is in range and product is NOT in manual mode, NC terminal will open.
Remote Transfer	R0	Common Terminal for R1,R2,R3
	R1	Passive input signal, remote transfer to position I when closed with R0 and last for at least 200ms.
	R2	Passive input signal, remote transfer to position II when closed with R0 and last for at least 200ms
	R3	Passive input signal, remote transfer to position O when closed with R0 and last for at least 200ms

Remote Transfer Process

The RTSE transfers to a stable position after receiving a rising edge signal. The rising edge signal should last for no less than 200 ms.

The RTSE will remain on the stable position until receiving a new signal. It will not respond to the new signal when:

- Position slider is in the left and transfer switch equipment is in RUN mode.
- Transfer switch equipment is in alarm state.
- Transfer switch equipment is executing the transfer action.

█ : No requirement on the signal voltage level. It can either be high or low level.

Switching Devices

M

Complete Source-changeover Assembly (or MTSE: Manual Transfer Switching Equipment)

Definition of Class PC

Transfer switch equipment based on mechanical switching devices, that do not need electrical power to hold the main contacts open or closed and capable of making, carrying, and breaking currents under normal circuit conditions including operating overload conditions, and making and withstanding short-circuit currents.

Definition of Derived TSE

TSE based on switching devices that have certain tests required for compliance with IEC 60947-6-1 as defined in Table 9, covered by IEC 60947-3 for Class PC, IEC 60947-2 or IEC 60947-6-2 for Class CB, or IEC 60947-4-1 for Class CC

Definition of MTSE (Manual Transfer Switching Equipment)

Manually operated transfer switching equipment, transfer switching equipment operated manually and non-electrically.

TransferPacT FXM is a Class PC, Derived MTSE (Complete Source-Changeover Assembly)

These assemblies provide an easy way to implement source changeover functions with:

- A single 3-position rotary handle that controls the two switch-disconnectors (Normal source ON, OFF, Replacement source ON)
- A smaller size, taking up less room in the switchboard.

A complete source changeover assembly can be ordered with a single catalog number.

Manual, Remote and Automatic Transfer Switch

Schneider Electric offers source change-over systems based on ComPacT and MasterPacT devices. They are made of up to 3 circuit breakers or switch-disconnectors linked by an electrical interlocking system that may have different configurations. Moreover, a mechanical interlocking system must be added to protect against electrical malfunctions or incorrect manual operations. In addition, a controller can be used for automatically control the source transfer.

The following pages present the different solutions for mechanical and electrical interlocking and associated controllers.

Information

IEC 60947-6-1 applies to transfer switching equipment (TSE) to be used in power systems for transferring a load supply between a normal and an alternate source (other power supply or generator).

TSE is classified according to

- The method of controlling the transfer
 - Manually transfer switching equipment (MTSE)
 - Automatic transfer switching equipment (ATSE)
- their short circuit capability
 - Class PC: TSE that is capable of making and withstanding, but not intended for breaking short-circuit currents. Switch and switch-disconnectors are the most useful products used.

□ Class CB: TSE that is capable of making, withstanding, it's intended for breaking short-circuit currents and is provided with over-current releases. Circuit breakers (air circuit breaker or moulded-case circuit breaker) are the most useful products used.

Mechanical interlocking using connecting rods

Mechanical interlocking by cables

Mechanical interlocking by cables

[1] Implemented with NS630b to NS1600 electrically-operated devices only.
 [2] For source-changeover systems using cables, always respect the installation conditions specified on.
 [3] Not compatible with automatic controller.

Note: for other cases, please consult us.

TransferPacT

Mechanical Interlocking

PB113435.eps

Interlocking of two or three toggle-controlled devices.

PB113415-N.eps

Interlocking of two devices by rotary handles.

PB113829.eps

Interlocking with keylocks.

Interlocking of Two or Three Toggle-Controlled Devices

Interlocking system

Two devices can be interlocked using this system. Two identical interlocking systems can be used to interlock three devices installed side by side.

Authorized positions:

- one device closed (ON), the others open (OFF)
- all devices open (OFF).

The system is locked using one or two padlocks (Ø5 to 8 mm).

This system can be expanded to more than three devices.

There are two interlocking-system models:

- one for ComPacT INS/INV
- one for ComPacT NSX100 to NSX250
- one for ComPacT NSX400 to NSX630.

Combinations of Normal and Replacement devices

All toggle-controlled fixed or plug-in ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors of the same frame size can be interlocked. The devices must be either all fixed or all plug-in versions.

Interlocking of Two Devices By Rotary Handles

Interlocking system

Interlocking involves padlocking the rotary handles on two devices which may be either circuit breakers or switch-disconnectors.

Authorized positions:

- one device closed (ON), the other open (OFF)
- both devices open (OFF).

The system is locked using up to three padlocks (Ø5 to 8 mm).

There are two interlocking-system models:

- one for ComPacT INS/INV
- one for ComPacT NSX100 to NSX250
- one for ComPacT NSX400 to NSX630.

Combinations of Normal and Replacement devices

All rotary-handle fixed or plug-in ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors of the same frame size can be interlocked. The devices must be either all fixed or all plug-in versions.

Interlocking of Devices by Keylocks (Captive Keys)

Interlocking using keylocks is very simple and makes it possible to interlock two or more devices that are physically distant or that have very different characteristics, for example medium-voltage and low-voltage devices or a ComPacT NSX100 to NSX630 switch-disconnector and circuit breaker.

Interlocking system

Each device is equipped with an identical keylock and the key is captive on the closed (ON) device. A single key is available for all devices. It is necessary to first open (OFF position) the device with the key before the key can be withdrawn and used to close another device.

A system of wall-mounted captive key boxes makes a large number of combinations possible between many devices.

Combinations of Normal and Replacement devices

All rotary-handle ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors can be interlocked between each other or with any other device equipped with the same type of keylock.

TransferPacT

Mechanical Interlocking

Interlocking of Two Devices by Base Plate

Interlocking system

A base plate designed for two ComPacT NSX devices can be installed horizontally or vertically on a mounting rail. Interlocking is carried out on the base plate by a mechanism located behind the devices. In this way, access to the device controls and trip units is not blocked.

Combinations of Normal and Replacement devices

All rotary-handle and toggle-controlled ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors can be interlocked. Devices must be either all fixed or all plug-in versions, with or without earth-leakage protection or measurement modules.

An adaptation kit is required to interlock:

- two plug-in devices
- a ComPacT NSX100 to NSX250 with an NSX400 to NSX630.

Connection to the downstream installation can be made easier using a coupling accessory.

Downstream coupling accessory

This accessory simplifies connection to bars and cables with lugs. It may be used to couple two switch-disconnectors and circuit breakers of the same size, ComPacT INS/INV100 to 630 and ComPacT NSX100 to 630.

Pitch between outgoing terminals:

- ComPacT INS250 and INV100 to 250: 35 mm
- ComPacT INS/INV320 to INS/INV630: 45 mm
- ComPacT NSX100 to NSX250: 35 mm
- ComPacT NSX400 to NSX630: 45 mm.

For ComPacT NSX circuit breakers, the downstream coupling accessory can be used only with **fixed versions**.

Connection and Insulation Accessories

The coupling accessory can be fitted with the same connection and insulation accessories as the circuit breakers and switch-disconnectors.

Possible uses	Downstream coupling	
	Possible mounting	Outgoing pitch (mm)
Manual source-changeover systems		
INS250 (100 to 250 A) with rotary handle	■	35
NSX100 to NSX250 with rotary handle	■	35

TransferPacT

Mechanical Interlocking

For implementing the mechanical interlocking, two different possibilities are offered:

- interlocking with rods
- interlocking with cables.

Note: for mechanical interlocking application with connecting rods and cables, pushbutton cover is mandatory to prevent wrong mechanical close order.

Commercial references for pushbutton cover:

- MasterPacT MTZ1 : LV833897
- MasterPacT MTZ2 and MTZ3 : LV848536
- ComPacT NS630b to 1600: 33897

Interlocking with Rods

Interlocking of Two ComPacT NS630b to 1600 Devices Using Connecting Rods

Both devices must be installed one above the other.

For ComPacT NS, only associations between similar type devices are allowed (2 fixed or 2 drawout devices).

Installation

This function requires:

- an adaptation fixture on the right side of each circuit breaker or switch-disconnector
- a set of connecting rods with no-slip adjustments.

The adaptation fixtures, connecting rods and circuit breakers or switch-disconnectors are supplied separately, ready for assembly.

The maximum vertical distance between the fixing plates is 900 mm.

Possible combinations of "S1" and "S2" source circuit breakers

Combinations are possible between ComPacT NS devices and between ComPacT NS devices with MasterPacT MTZ1 devices (either 2 fixed or 2 withdrawable/drawout devices).

Interlocking of Two MasterPacT MTZ Using Connecting Rods

Both devices must be installed one above the other.

For MasterPacT MTZ1 only associations between similar type devices are allowed (2 fixed or 2 drawout devices).

For MasterPacT MTZ2 and MTZ3, all mixed associations between fixed type and drawout type devices are possible.

PB110491_R_34.eps

Interlocking of two MasterPacT MTZ1, MTZ2/MTZ3 circuit breakers using connecting rods.

	Source 2

NS630b to NS1600					●	●		
MTZ1					●	●		
MTZ2			●	●			●	●
MTZ3			●	●			●	●

Installation

This function requires:

- an adaptation fixture on the right side of each circuit breaker or switch-disconnector
- a set of connecting rods with no-slip adjustments
- a mechanical operation counter CDM (mandatory).

The adaptation fixtures, connecting rods, circuit breakers and switch-disconnectors are supplied separately, ready for assembly.

The maximum vertical distance between the fixing plates is 900 mm.

TransferPacT

Mechanical Interlocking

Interlocking with Cables

Interlocking of Two ComPacT NS630b to 1600 Devices Using Cables

For cable interlocking, the circuit breakers may be mounted one above the other or side-by-side.

The interlocked devices may be fixed or drawout, three-pole or four-pole, and have different ratings and sizes.

Installation

This function requires:

- an adaptation fixture on the right side of each device
- a set of cables with no-slip adjustments.

The maximum distance between the fixing plates (vertical or horizontal) is 2000 mm.

Possible combinations of “S1” and “S2” source circuit breakers

All mixed associations between ComPacT NS 630b to 1600 and MasterPacT MTZ1 or MTZ2 or MTZ3 fixed type and drawout type devices are possible.

Interlocking of Two or Three MasterPacT MTZ Using Cables

For cable interlocking, the circuit breakers can be installed either one above the other or side-by-side. All mixed associations between MasterPacT MTZ1, MTZ2, MTZ3 fixed type and drawout type devices are possible.

Note: mechanical interlocking for 3 devices is only possible with MTZ2 and MTZ3.

Interlocking between two MasterPacT MTZ1, MTZ2, MTZ3 devices

This function requires:

- an adaptation fixture on the right side of each device
- a set of cables without slip adjustments
- a mechanical operation counter CDM (mandatory).

The maximum distance between the fixing plates (vertical or horizontal) is 2000 mm.

Interlocking between three MasterPacT MTZ2, MTZ3 devices

This function requires:

- a specific adaptation fixture installed on the right side of each device
- two sets of cables without slip adjustments
- a mechanical operation counter CDM (mandatory).

The maximum distance between the fixing plates (vertical or horizontal) is 1000 mm.

Installation

The adaptation fixtures, sets of cables and circuit breakers or switch-disconnectors are supplied separately, ready for assembly.

Installation conditions for cable interlocking systems:

- cable length: 2.5 m
- cable bending radius: greater than 100 mm
- maximum number of curves: 3.

Note: for cable length higher than 2.5 m please consult us before ordering the circuit breakers for a customized solution.

Choice Criteria

In applications where the continuity of service is critical^[1] (data centers, airports, hospitals, marine, oil&gas, process industry, etc.), mechanical interlocking by rods and drawout devices are strongly recommended.

Mechanical interlocking by rods is preferred as less energy is consumed by friction, so it has less effect on the circuit breaker closing energy.

In terms of breaker mounting type, the drawout version is preferred as :

- it provides mechanical isolation of the circuit breaker from possible external stress on the terminals by having a flexible connection at cluster level
- it allows simple and total access for periodic maintenance
- it allows quick replacement of the device if necessary.

When not possible, cable interlocking or fixed versions can be used, but the installation rules detailed in the 2 sections below must be strictly respected and mainly:

- the busbars or the cables used for power connection must apply no stress on the circuit breaker terminals.

Their weight must be supported by the switchboard frame.

Interlocking of two MasterPacT circuit breakers using cables.

PB113432_R_30.jpg

D

[1] For more details please contact your local support.

Note: for more details on installation rules, please also refer to “MasterPacT MTZ User Guide”.

TransferPacT

Electrical Interlocking - IVE unit

Electrical interlocking is used with a mechanical interlocking system. Moreover, the relays controlling the closing order to the “N” and “R” circuit breakers must be mechanically and/or electrically interlocked to prevent them from giving simultaneous closing commands.

Electrical interlocking is carried out by an electrical control device.

For ComPacT NSX up to 630 A, electrical interlocking is implemented by the IVE unit integrating control circuits and an external terminal block in accordance with the page D-47 of the chapter “Electric diagrams” of this catalog.

The integrated control circuits implement the time delays required for correct source transfer.

For ComPacT NS630b to NS1600 and MasterPacT, this function can be implemented in one of two ways:

- Using the IVE unit
- By an electrician based on the diagrams in accordance with the pages D-61 to D-70 of the chapter “Electric diagrams” of this catalog.

Characteristics of the IVE unit

- External connection terminal block:
 - Inputs: circuit breaker control signals
 - Outputs: status of the SDE contacts on the “N” and “R” source circuit breakers.
- 2 connectors for the two “N” and “R” source circuit breakers:
 - Inputs:
 - Status of the OF contacts on each circuit breaker (ON or OFF)
 - Status of the SDE contacts on the “N” and “R” source circuit breakers
 - Outputs: power supply for operating mechanisms.
- Control voltage:
 - 24 to 250 V DC
 - 48 to 415 V 50/60 Hz - 440 V 60 Hz.

The IVE unit control voltage must be same as that of the circuit breaker operating mechanisms.

IVE unit.

IVE Unit

Symbols

- | | |
|---|---|
| QN: “Normal” ComPacT circuit breaker equipped for remote operation (motor mechanism) | IN: Circuit breaker QN closing order |
| QR: “Replacement” ComPacT circuit breaker equipped for remote operation (motor mechanism) | IR: Circuit breaker QR closing order |
| ON: Circuit breaker QN opening order | L1: Faulty “Normal” indication LED |
| OR: Circuit breaker QR opening order | L2: Faulty “Replacement” indication LED |

Key

- O: OFF (circuit open)
- I: ON (circuit closed)
- : either ON or OFF.

Note: following all trips (overload, short-circuit, earth-leakage fault, voluntary trip), a manual reset on the front of the motor mechanism is required.

TransferPacT

Electrical Interlocking - IVE unit

Necessary Equipment

For ComPacT NSX100 to NSX630, each circuit breaker must be equipped with:

- A motor mechanism
- An OF contact
- An SDE contact

The components are supplied ready for assembly and the circuit breakers prewired. The prewiring must not be modified.

For ComPacT NS630b to NS1600, each circuit breaker must be equipped with:

- A motor mechanism
- An available OF contact
- A CE connected-position contact (carriage switch) on withdrawable circuit breakers
- An SDE contact

For MasterPacT MTZ, each circuit breaker must be equipped with:

- A remote-operation system made up of:
 - MCH gear motor
 - MX or MN opening release
 - XF closing release
 - PF "ready to close" contact
- CDM mechanical operation counter (mandatory)
- An available OF contact
- One to three CE connected-position contacts (carriage switches) on drawout circuit breakers (depending on the installation).

ComPacT NSX

- A** Circuit breaker QS1 equipped with a motor mechanism and auxiliary contacts, connected to the N source
- B** Circuit breaker QS2 equipped with a motor mechanism and auxiliary contacts, connected to the R source
- C** Base plate with mechanical interlocking
- D** Electrical interlocking unit IVE
- E** Coupling accessory (downstream connection)

MasterPacT MTZ

TransferPacT Controllers

Controller Selection

By combining a remote-operated source-changeover system with an integrated BA or UA automatic controller, it is possible to automatically control source transfer according to user-selected sequences. These controllers can be used on source-changeover systems comprising 2 circuit breakers. For source-changeover systems comprising 3 circuit breakers, the automatic control diagram must be prepared by the installer as a complement to diagrams provided in the “electrical diagrams” section of this catalog.

[1] The controller is powered by the ACP control plate. The same voltage must be used for the ACP plate, the IVE unit and the circuit breaker operating mechanisms. If this voltage is the same as the source voltage, then the “Normal” and “Replacement” sources can be used directly for the power supply. If not, an isolation transformer must be used.

TransferPacT Controllers

Controller Installation

TransferPacT ACP Control Plate

The control plate provides in a single unit:

- protection for the BA or UA controller with two highly limiting P25M circuit breakers (infinite breaking capacity) for power drawn from the AC source
- control of circuit breaker ON and OFF functions via two relay contactors
- connection of the circuit breakers to the BA or UA controller via a built-in terminal block.

Control voltages

- 110 V 50/60 Hz.
- 220 to 240 V 50/60 Hz.
- 380 to 415 V 50/60 Hz and 440 V 60 Hz.

The same voltage must be used for the TransferPacT ACP control plate, the controller and the circuit breaker operating mechanisms.

Installation

Connection between the TransferPacT ACP control plate and the IVE unit may use:

- wiring done by the installer
- prefabricated wiring (optional).

Installation of the BA and UA Controllers

The BA and UA controllers may be installed in one of two manners:

- directly mounted on the TransferPacT ACP control plate
 - mounted on the front panel of the switchboard
- if the length of the connection between the controller and the control plate (ACP) is less than or equivalent to 1 m, the connecting cable **ref. 29368** can be ordered as an optional extra. Cables longer than 1 m, but not longer than 2 m will be the responsibility of the installer.

TransferPacT ACP control plate.

Mounting on the TransferPacT ACP control plate.

Mounting on the front panel of the switchboard.

TransferPacT Controllers

BA Controller

The BA controller is used to create simple source-changeover systems that switch from one source to another depending on the presence of voltage U_N on the "Normal" source. It is generally used to manage two permanent sources and can control ComPact NS, ComPact NSX and MasterPacT MTZ circuit breakers and switch-disconnectors.

Front of the BA controller.

Operating Modes

A four-position switch may be used to select:

- automatic operation
- forced operation on the "Normal" source
- forced operation on the "Replacement" source
- stop (both "Normal" and "Replacement" sources off).

Setting the Time Delays

Time delays are set on the front of the controller.

t1. delay between detection that the "Normal" source has failed and the transmission of the order to open the "Normal" source circuit breaker (adjustable from 0.1 to 30 seconds).

t2. delay between detection that the "Normal" source has returned and the transmission of the order to open the "Replacement" source circuit breaker (adjustable from 0.1 to 240 seconds).

Circuit Breaker Commands and Status Indications

The status of the circuit breakers is indicated on the front of the controller.

- ON, OFF, fault.

A built-in terminal block may be used to connect the following input/output signals:

- inputs:
 - voluntary order to transfer to source R (e.g. for special tariffs, etc.)
 - additional control contact (not part of the controller). Transfer to the "Replacement" source takes place only if the contact is closed (e.g. used to test the frequency of UR, etc.)
- outputs:
 - indication of operation in automatic or stop mode via changeover contacts.

Test

It is possible to test the operation of the BA controller by turning OFF (opening) the P25M circuit breaker for the "Normal" source and thus simulating a failure of voltage U_N .

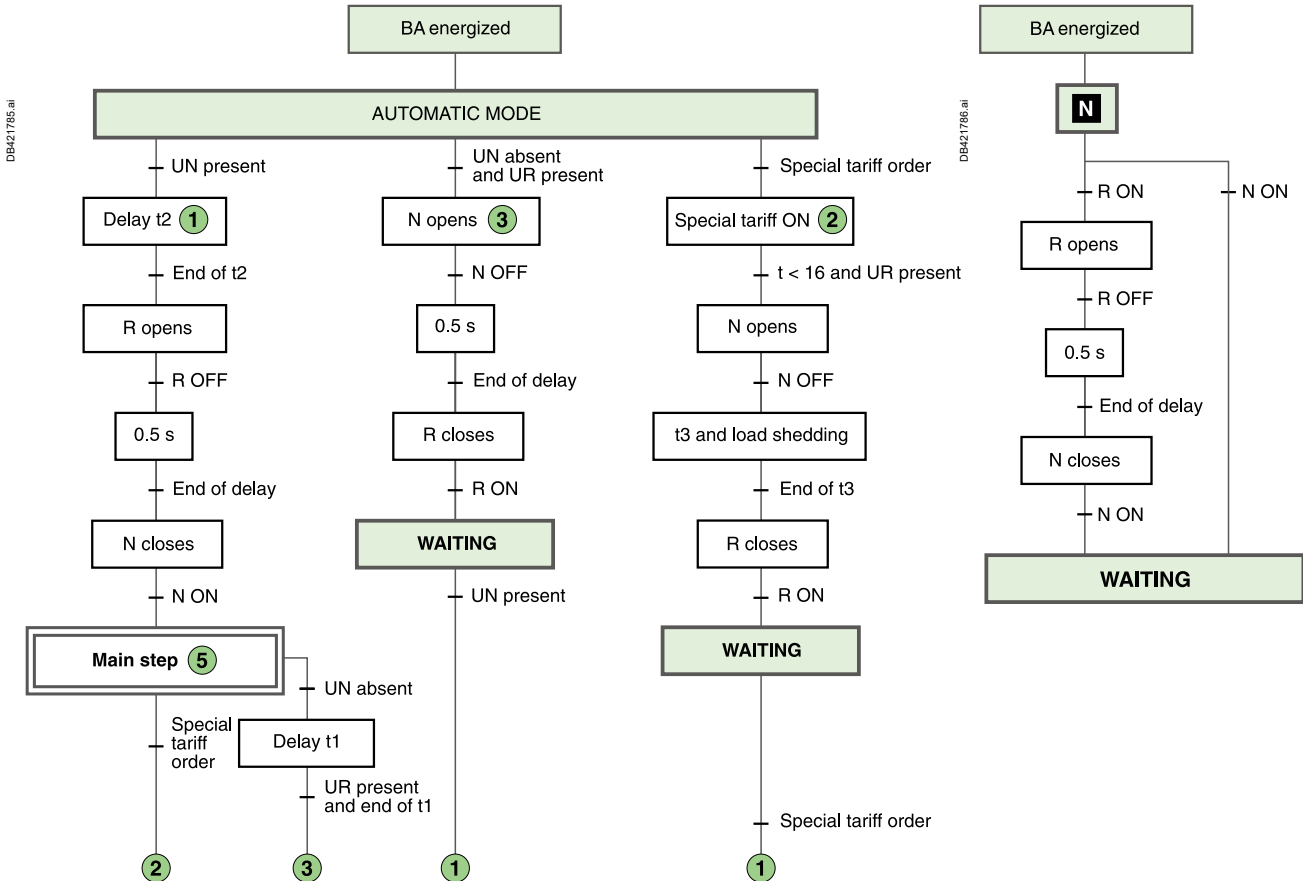

TransferPacT Controllers

BA Controller

Operating Sequences

Switch Set to Auto (automatic operation and special-tariff mode)

Switch Set to the "N" Position (forced operation on the "Normal" source)

Switch set to the "R" position (forced operation on the "Replacement" source)

Switch set to the "Stop" position

Key

- UN: "Normal" source voltage
- UR: "Replacement" source voltage
- N : "Normal" source circuit breaker
- R: "Replacement" source circuit breaker

WAITING The system exits this mode when the operating mode is modified or when an external event occurs (e.g. failure or return of UN).

① The number sends to the indicated step when the condition is true.

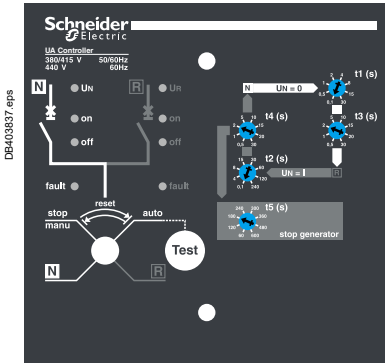

TransferPacT Controllers

UA controller

The UA controller is used to create a source-changeover system integrating the following automatic functions:

- transfer from one source to another depending on the presence of voltage UN on the “Normal” source
- startup of an engine generator set
- shedding and reconnection of non-priority circuits
- transfer to the “Replacement” source if one of the phases on the “Normal” source fails.

The UA controller can control ComPact NS, ComPact NSX and MasterPacT MTZ devices.

Front of the UA controller.

Operating Modes

A four-position switch may be used to select:

- automatic operation
- forced operation on the “Normal” source
- forced operation on the “Replacement” source
- stop (both “Normal” and “Replacement” sources off, then manual operation).

Setting the Time Delays

Time delays are set on the front of the controller.

- t1.** delay between detection that the “Normal” source has failed and the transmission of the order to open the “Normal” source circuit breaker (adjustable from 0.1 to 30 seconds).
- t2.** delay between detection that the “Normal” source has returned and the transmission of the order to open the “Replacement” source circuit breaker (adjustable from 0.1 to 240 seconds).
- t3.** delay following opening of QN with load shedding and before closing of QR (adjustable from 0.5 to 30 seconds).
- t4.** delay following opening of QR with load reconnection and before closing of QN (adjustable from 0.5 to 30 seconds).
- t5.** delay for confirmation that UN is present before shutting down the engine generator set (adjustable from 60 to 600 seconds).
- t6.** delay before startup of the engine generator set (120 or 180 seconds).

Commands and Indications

Circuit breaker status indications on the front of the controller:

- ON, OFF, fault.

A built-in terminal block may be used to connect the following input/output signals:

- inputs:
 - voluntary order to transfer to source R (e.g. for special tariffs, etc.)
 - additional control contact (not part of the controller). Transfer to the “Replacement” source takes place only if the contact is closed (e.g. used to test the frequency of UR, etc.)
- outputs:
 - control of an engine generator set (ON / OFF)
 - shedding of non-priority circuits
 - indication of operation in automatic mode via changeover contacts.

Distribution-System Settings

Three switches are used to:

- select the type of “Normal” source, whether single-phase or three-phase (e.g. 240 V single-phase or 240 V three-phase)
- select whether to remain (or not) on the “Normal” source if the “Replacement” source is not operational during operation on special tariffs
- select the maximum permissible startup time for the engine generator set during operation on special tariffs (120 or 180 seconds).

Test

A pushbutton on the front of the controller may be used to test transfer from the “Normal” source to the “Replacement” source, then the return to the “Normal” source. The test lasts approximately three minutes.

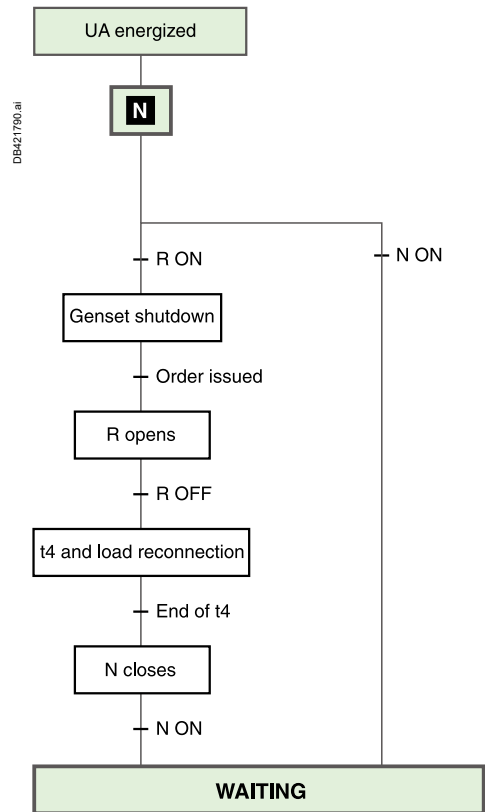

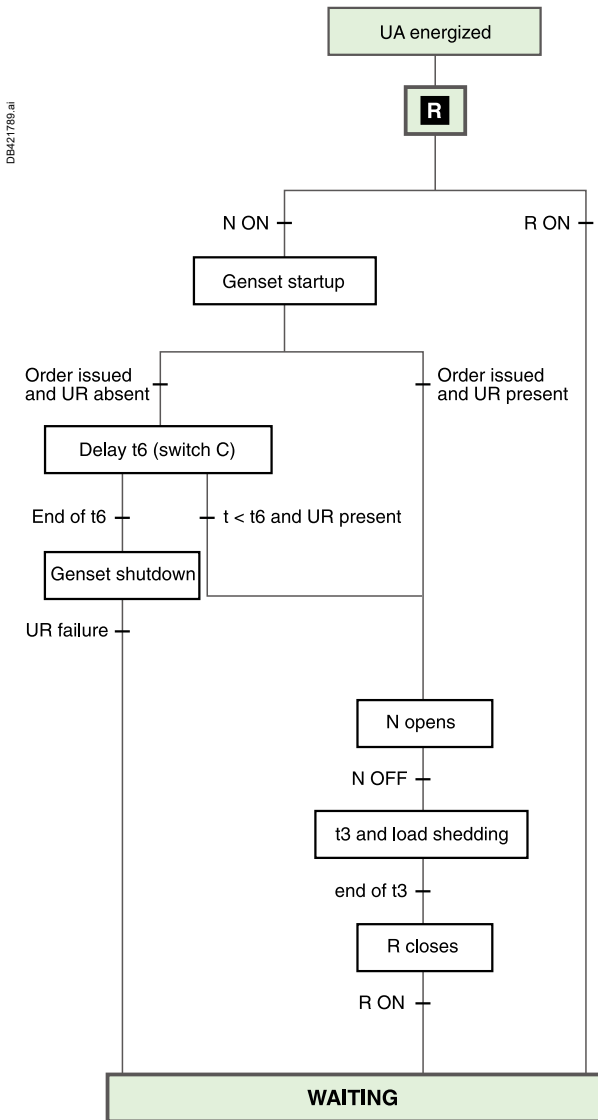

TransferPacT Controllers

UA Controller

Operating Sequences, Forced Operation Mode

Switch set to the "R" position (forced operation on the "Replacement" source)

Switch set to the "N" position (forced operation on the "Normal" source)

<p>[1] possible by forcing operation</p>																								

"Lockout after fault" option. This option makes it necessary to manually reset the device following fault tripping.

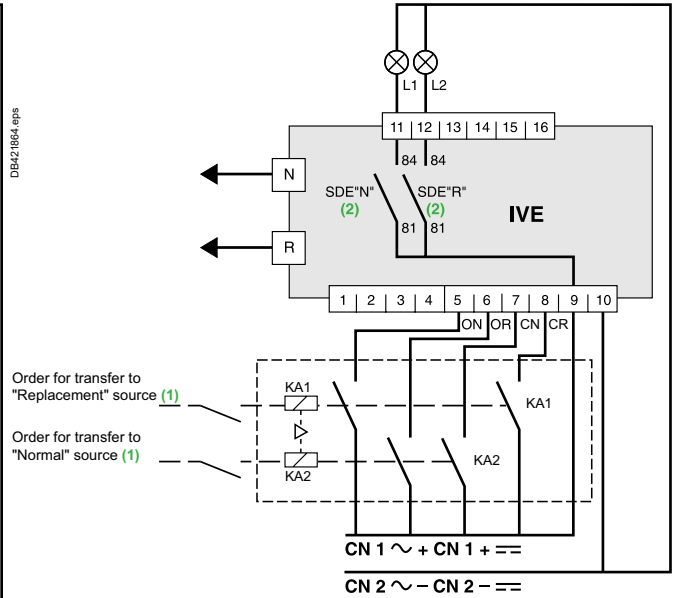

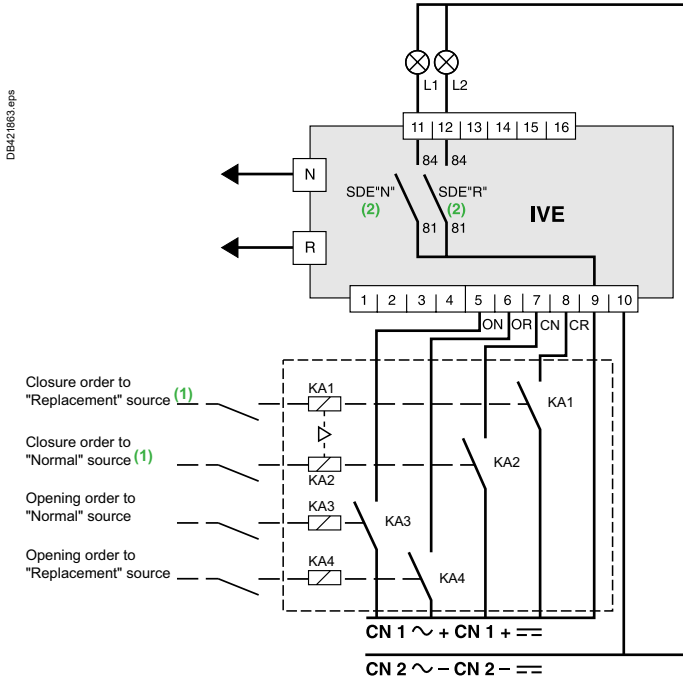

Remote-Operated Source-Changeover Systems

2 ComPacT NSX100/630, NS630b/1600
or MasterPacT MTZ1/MTZ2/MTZ3 Devices

Electrical Interlocking By The Ive Unit

Independent order to Normal/Replacement source

Simultaneous order to Normal/Replacement source

Controlling each circuit breaker independently.

Control of two circuit breakers by "common" transfer order.

[1] See section "IMPORTANT" here after.

[2] Operating diagram: the SDE "fault-trip" signals are transmitted to the IVE unit. The SDE auxiliary contacts are mounted in the circuit breakers.

IMPORTANT

The relays controlling the closing order to the "Normal" and "Replacement" circuit breakers must be mechanically and/or electrically interlocked to prevent them from giving simultaneous closing commands.

It is recommended to use **Tesys K** relays from Schneider Electric reference LC2-K06010●●. These relays are mechanically and electrically interlocked.

Source-Changeover Systems with UA Controllers

Controller Settings

Source Changeover System with UA Controller

Controller settings

Tests on "Normal" source voltage

A = 0 single-phase test,

A = 1 three-phase test.

Voluntary transfert (e.g. for energy management)

■ action in the event of genset failure

B = 0 circuit breaker N opens,

B = 1 circuit breaker N remains closed.

■ maximum permissible genset startup time (T6)

C = 0 T = 120 s,

C = 1 T = 180 s.

After this time has elapsed, the genset is considered to have failed.

ComPacT NS630b to NS1600

Circuit breakers and switch-disconnectors

To indicate your choices, check the applicable square boxes and enter the appropriate information in the rectangles .

Diagram for two ComPacT NS devices

Electrical interlocking with lockout after fault:

Permanent replacement source (with IVE unit)	(no. 51201183)	<input type="checkbox"/>
With emergency off by MX (with IVE unit)	(no. 51201184)	<input type="checkbox"/>
With emergency off by MN (with IVE unit)	(no. 51201185)	<input type="checkbox"/>

Interlocking using connecting rods between two NS630b to NS1600 devices

Manually operated devices installed side-by-side:

For two fixed NS devices with extended rotary handles

Electrically operated devices installed one above the other:

Select a complete set including two adaptation fixtures and the connecting rods

Complete set for:	2 fixed NS devices	<input type="checkbox"/>
	2 withdrawable NS devices	<input type="checkbox"/>

Interlocking using cables between two NS630b to NS1600 devices

Electrically operated devices installed one above the other or side-by-side:

Select a complete set including two adaptation fixtures and the cables

Complete set for:	2 fixed NS devices	<input type="checkbox"/>
	2 withdrawable NS devices	<input type="checkbox"/>
	1 fixed NS device + 1 withdrawable NS device	<input type="checkbox"/>

Electrical interlocking between two NS630b to NS1600 devices

1 IVE unit 48/415 V - 50/60 Hz and 440 V - 60 Hz	<input type="checkbox"/>
1 wiring kit for connection between 2 fixed / withdrawable devices to the IVE unit	<input type="checkbox"/>

Automatic-control option

Power supply 110 V - 50/60 Hz:	ACP + BA controller	<input type="checkbox"/>
	ACP + UA controller	<input type="checkbox"/>
	ACP + UA150 controller	<input type="checkbox"/>
Power supply 220/240 V - 50/60 Hz:	ACP + BA controller	<input type="checkbox"/>
	ACP + UA controller	<input type="checkbox"/>
	ACP + UA150 controller	<input type="checkbox"/>
Power supply 380/415 V - 50/60 Hz and 440 V - 60 Hz:	ACP + BA controller	<input type="checkbox"/>
	ACP + UA controller	<input type="checkbox"/>
	ACP + UA150 controller	<input type="checkbox"/>
